W^* -superrigidity for Bernoulli actions of property (T) groups

I will present a new result proving that Bernoulli actions $\Gamma \curvearrowright X$ of ICC property (T) groups Γ are W^* -superrigid. This means that if $\Lambda \curvearrowright Y$ is any other free, ergodic, measure preserving action such that the associated group measure space II_1 factors are isomorphic, then the groups are isomorphic and the actions are conjugate. The proof is based on a classification result for embeddings of $M = L^\infty(X) \rtimes \Gamma$ into $\overline{M \otimes M}$.
